## Functionality : User Stories

- As a user, I want to have a centralized homepage ✓
- As a user, I want to be able to accept user input for the content they want to follow ✓
- As a user, I want to be able to store the Reddit articles in a database ✓
- As a user, I want to see what's trending on Youtube ✓
- As a user, I want to see what's trending on Twitter ✓
- As a user, I want to be able to view without going to Youtube ✓
- As a developer, I want to add a UI trending slide ✓
- As a user, I want an archive page to see past searches ✓
- As a user, I want a friendly and easy to use UI ✓
- As a developer, I want to have a clean Git master branch ✓

## Bug Report

- Server fails silently when DB error occurs. In the case of a store failure, user will not be informed of any problems (this is an issue for data the user is trying to save).
- Index.html fade mechanic is unreliable and bloated, and should be reworked.
- Index.html hangs for a very long time due to loading of youtube videos
- Twitter\_Post database model should be adjusted for clarity and safety. Currently, it is more of a hacked together model than anything permanent (this is due to using and conforming to third-party templatetags).

- Reddit results do not count sticky posts, even if the sticky post is actually a new post
- Reddit crawler will loop infinitely (or crash) if a subreddit does not have at least five non-sticky posts
- Archive page does not support showing all three API categories at once, will not display others if checked AFTER the initial check (except Reddit as that seems to be prioritized)
- Queries with spaces are not saved in archive drop down menu
